

S3 Figure: DENV challenge on heat-treated wild-type, wAlbB- and wMel-carrying Ae. aegypti. Salivary glands from heat-treated females were assessed for virus dissemination by Fluorescent Focus Assay (FFA). Dots represent the number of foci/ml per single mosquito (A). Dissemination rates from the same experiments are represented in panel B. Proportions on each bar indicate the infection rates (N positive/N total). Statistical analysis was performed using Mann-Whitney test and Fisher's exact test. '****' 0.001 '**' 0.01 '*' 0.05 'ns' not significant.
